

MRP – ACCOUNTS DATA – WHAT AND WHERE

This document shows the information stored regarding accounting operations and the relationships between the places the data is stored. These places are referenced throughout the system in a number of different ways.

The following table shows a list and description of where accounting data is stored, note the last column “Father/Son”? That means that table is either “father” or a “son” which means there is a “father-son” relationship between one of more tables. That means one “father” record is written in a table and the “son(s)” are written in another.

E.g. a sales order has one “father” record which contains the bill too address and payment terms and the “son(s)” contain the individual line items for that order.

Table Name	Description	Father/Son
APD	Accounts Payable Debit – Contains account numbers for each debit memo created through “Debit Memo”.	Son
APG	Accounts Payable GL – Contains miscellaneous invoice lines created through the “A/P Invoice Entry”.	Son
API	Accounts Payable Invoice – Contains data for invoice line numbers created through “A/P Invoice Entry” for items on a purchase order.	Son
APM	Accounts Payable Master – Contains one APM record for each invoice ID created through the “A/P Invoice Entry” form.	Father
APP	Accounts Payable Payments – Contains records of payments made against each invoice through either “Process Checks” or “A/P Handwrite”.	Father
ARC	Accounts Receivable Credit – Contains account numbers for each credit memo entered through “Credit Memo”.	Father
ARM	Accounts Receivable Master – Contains one ARM record for each invoice created through the invoicing operations. The lines are detailed through the invoicing tables (IVM, IVI, IVD).	Father
ARP	Accounts Receivable Payments – Contains records of payments received against each invoice through “Cash Application”. One ARP record is created for each payment against an invoice.	Father
ARPI	Case Receipts Commissions – Created for each commissionable invoice when commissions are accrued at “Cash Receipt”.	Son
BCT	Batch Table – Contains A/P batch identifiers created through “A/P Invoice Entry” used in A/P reporting	Son
BUD	Budgets – Contains budget information (including period, account number and amount) for each budget created via “Budget Maintenance”.	Father
CHI	Check Invoice Detail – Contains detail of each invoice that was paid against a check created from “Process Checks” and “A/P Handwrite”.	Son
CHK	Check Records – Contains a record of each A/P check, One CHK record is created for each check generated from “Process Checks” or “A/P Handwrite”.	Father
COA	Chart of Accounts – Contains all General Ledger account numbers created from “Chart of Accounts Maintenance”.	Father
COM	Company Master – Contains all General Ledger account numbers created from “Chart of Accounts Maintenance”.	Father
COP	Company Periods – Contains the General Ledger fiscal periods for the year created in “Period Maintenance”.	Father
GLD	General Ledger Detail – Contains beginning balance, total debit, total credit and ending balance for each account number in the period. As GLT records are posted through the “Post GLT's” operation and JET records are posted through “Post Journal Entries”, GLD records are updated. The GLD table is used in financial statements.	Son
GLT	General Ledger Transaction – Contains a record for each transaction made in the system that affects the Trial Balance position. This record contains debits and credit accounts, an amount and tracking data these records are posted in batch to the Trial Balance from “Post GLT's”.	Father

MRP – ACCOUNTS DATA – WHAT AND WHERE

GLTH	General Ledger Transaction History – GLT records are purged as they are posted to the Trial Balance through “Post GLT's” and are re-created here.	Father
GRP	Group – Contains all of the user groups defined within each type (asset, revenue, equity, liability, operating expense, non operating expense, COGS and income tax). Groups are entered through the “Master Controls Explorer”	Father
JEA	Journal Entry Accounts – Contains the detail behind each Journal Entry. One JEA record is created for each account number (debit and credit) that are entered from “Manual Journal Entry”.	Father
JET	Journal Entries – Contains one record for each manual journal entry created from “Manual Journal Entry” or through “Convert Recurring Journal Entry”.	Father
RAP	Recurring Accounts Payables	Father
RCP_API	The link between API and the purchase order receipt records. Contains the information recorded when lines are matched to receivers from “A/P Invoice Entry”.	Son
RJA	Recurring Journal Entry Accounts – Contains the detail behind each Recurring Journal Entry record. One RJA Is created for each account number (debit and credit) created from “Recurring Journal Entry”.	Son
RJC	Recurring Journal Convert – Contains a counter for Recurring Journal Entry conversion. This tracks when each RJE is converted each period to prevent multiple conversions in one period.	Father
RJE	Recurring Journal Entries – Contains one record for each recurring journal entry created from “Recurring Journal Entry”.	Son
SCL	Shop Calendar – Contains a list of each calendar day coded as either working or non working day entered from “Shop Calendar”. This is used in planning and in calculating start and complete dates for work orders.	Father
