using System.Windows.Forms;
/*
    Created 05/11/2024 by Roger Williams

    reads level datatext file and creates a new text file
    writing the level data as a javaScript array of objects

*/

namespace ConvertLevelToJavaScriptObject
{
    public partial class frmMain : Form
    {
        string strLevelFileLocation = "";
        string strSaveFileLocation = "";

        public frmMain()
        {
            InitializeComponent();
        }

        private void ConvertFile()
        {
            /*
                Modified 13/11/2024 by Roger Williams

                code for upgrade to include which rooms cause win/loss properties  ➤
                in the room object
                NOTE: version one of the level file does not have this hence code  ➤
                disabled
                BUT did enable to create the new structure for the javaScript ➤
                version :)

                Created 05/11/2024 by Roger Williams

                reads level data and creates a new text file writing the level data ➤
                as a javaScript array of objects
                includes empty first element so room 1 is element 1

                example file excerpt:

1
0
3
0
2
It is a cold Monday morning. The rain beats heavily against the window, turning ➤

```

everything grey and miserable.

You stand by your desk, Windows 11 is chuntering to itself (as it does) and you know it will be at least 15 minutes

```

there are 20 lines of level text
*/
